

Joe is trying to get crazy jacked and juicy for his bodybuilding competition in the summer. He always listens to songs that get him hyped to lift heavy weights.

Joe listens to a wide variety of music genres to get his hype going. Although, only a handful of songs and artists within each genre can get him hyped up.

Joe vents to his friend about how he is growing tired of the songs he has in his playlist but, when he tries to browse for new songs in the app he struggles to find songs that hype him up.

Joe's friend recommends searching the app store for an app that can find songs he may like more efficiently. With a quick search, Joe is intrigued by an app called Music Tinder due to his familiarity with the swiping method used by dating apps.

Joe downloads the app and follows the comprehensive steps to make an account and import his playlists from compatible streaming services. The app takes songs from Joe's playlists and runs them through a program to filter through songs and find ones that are appealing to Joe's taste.

Joe can then browse through the app in a similar way to a dating site. The app plays snippets of songs Joe may like, and he can swipe right to approve a song and left to disapprove. The program updates Joe's preference on every swipe to improve the ratio of songs Joe approves.
